

Keep Calm and Log Everything

Humio is a high performance log management solution that delivers real-time monitoring and investigation capabilities for developers and operations teams. Humio is available in both on-prem and cloud versions. Unlike other solutions, Humio is:

SCALABLE	Proprietary time-series DB engine can efficiently handle multi TB/day log volumes (<i>one single instance of Humio can ingest up to a 1 TB of log volume/day</i>)
FAST	Real-time streaming capabilities built in for live query and dashboard capabilities
EASY to USE	Query language and web interface that developers and operations teams love to use

Observability Site License

For customers who have large and growing log volumes, we offer an annual Observability site license for unlimited logging. This is an ideal solution for organizations that have of multi TB/day log volumes and would like a simple on-prem deployment model.

Key Features

- Streaming queries and dashboards stored in an in-memory state machine for instant data access
- Linear scaling and exceptional search speed
- Ad-hoc and historical search with a simple query language
- Live dashboards and shareable dashboard widgets
- Open API for data ingest and support for open source log shippers (logstash and filebeat) and common log and data formats (fluentd, syslog, nginx, json, kafka...)
- Alerting integrations with Slack, PagerDuty, VictorOps, OpsGenie, email and webhooks.

Benchmark Data

The data below is from a customer production environment at a large EU public sector organization. This customer has a Humio Observability Site license and they collect and analyze multiple data sources in their security operations and support team. The following are their performance results and hardware specifications:

Data Ingest	12 TB/day with bursts up to 20 TB/day
Events/second:	100,000 - 250,000 events per second
Search speed	200-300GB/s
Data compression	12X
Total disk space (7 machines)	340 TB
Retention	180+ days
Machines	7 Humio machines + 3 Kafka machines

Data Driven Logging

With the Observability site license, organizations can add instances and scale up as their data volumes grow or burst. For observability or infrastructure teams who want to deploy multi-tenant logging infrastructures across development teams within an organization, Humio can provide a simple pricing for a deployment model to address this scenario.

We at Humio believe in the value of data-driven logging and the benefits companies can derive from this in their observability stack. With our simple pricing and unique product, Humio is on a mission to bring this value to engineering teams who've been struggling until now.
